What is Heart Failure?

Heart failure, or HF, is a diagnosis that means your heart is not pumping enough blood to the rest of your body.

This can cause you to feel short of breath, tired or have swelling in your legs or belly.

Normally, the heart fills completely and pumps out 55-65% of this blood every beat. This number is called your ejection fraction (EF), and can be low in heart failure.

There are two major kinds of heart failure:
1. Systolic heart failure: the heart cannot pump blood out well.
2. Diastolic heart failure: the heart is stiff and cannot fill with blood well.

It is possible to have both systolic and diastolic types of heart failure at the same time.
Acute right heart failure

- Loss of appetite
- Lower leg edema
- Weight gain

Acute left heart failure

- Shortness of breath during exertion
- Upright respiration position
- Shortness of breath and coughing at night
- Palpitations
- Fatigue and tiredness

Upright respiration position

Shortness of breath and coughing at night
Keys to Living Well with Heart Failure

- Monitor your symptoms every day.
- Weigh yourself every morning.
- Eat the right amount of salt.
- Drink the right amount of fluids.
- Take your medication every day.
- Exercise and stay active.
- Call your doctor with change in symptoms.
### Heart Failure Zones

Check your symptoms everyday!

<table>

</table>

**ALL ARE GREEN:**
My symptoms are in control! I will continue with my normal daily routine

**ONE OR MORE ARE YELLOW:**
I need to take action TODAY!
I will call my doctor
____________________
at (____) ________

**ONE OR MORE ARE RED:**
I need to take immediate action and call my doctor's office or 911!

CALL YOUR DOCTOR if you are in the "Yellow" or "Red" zone.
How to weigh yourself every morning:

1. On the same scale
2. Close to the same time every day
3. After going to the bathroom
4. Before getting fully dressed
5. Before eating breakfast
6. Write weight down and keep a log. Take the log with you to your doctor’s visits
7. Sample log in the back of this book
8. Call your doctor for weight gain (3 lbs. in a day or 5 lbs. in a week)

Changes in body weight can be a sign that your body is holding onto too much fluid.

Talk to your doctor about your goal or “target” weight at each visit. This is the weight where you will feel your best.

*If you do not own a scale and cannot afford one, please notify your nurse.
Why limit salt

The more salt you consume, the more fluid you retain. This can make your symptoms worse. Follow the recommendation of your doctor to see how much salt you are able to have in your diet. The American Heart Association recommends a daily salt (sodium) intake of 2,000 mg, or 2 grams.

1 teaspoon salt = 2400 mg of sodium

Nutrition Facts

- Serving Size: 1 Cup (228g)

The Size of Each Serving
For example, a single serving of this food is one cup (228g).

Amount of Sodium
This food has 660 mg of sodium per serving (one cup).
How to eat less salt:

- Get rid of the salt shaker and replace it with one of the no salt seasoning blends, like Mrs. Dash, or pepper. Use caution using sea salt, Nu salt or Himalayan salt, may increase Potassium. They are all sources of salt (sodium).
- Read food labels! Salt is hidden in most foods, so it is very important for you to know how to read labels to find low-sodium foods.
- Limit eating at restaurants, especially fast food. You can research sodium amounts in restaurants on the internet.

Tips and Tricks for eating out:
- Skip sauces, gravies, soups
- Choose fresh meat or fish is baked, broiled, grilled, poached, roasted or steamed
- Ask for side salad, fruit or steamed vegetables, without salt or butter instead of fries or potato chips
- Try lemon juice or vinegar and oil instead of dressing
- Drink water, plain coffee or tea

- Canned, packaged and frozen foods are often high in sodium.
Why Limit Fluids
Drink the right amount of fluids
Limiting fluid intake may help reduce your symptoms. Your doctor may recommend that you restrict fluid intake to 2000 ml, or 2 liters per day.

What counts?
1 cup = 8 ounces fluid
64 ounces fluid = 8 cups = 2000 ml = 2 liters
1 cup ice = ½ cup water

Dehydration symptoms
1. Dizziness or Lightheadedness
2. Weakness or more tired
3. Low Blood pressure
4. Weight loss (3 lbs. in a day or 5 lbs. in a week)

Helpful Hints
- Drink any fluid after your meal, not during your meal.
- If you absolutely need something to drink with your meal, use only a 4 ounce cup or Dixie® cup size.
- If you become thirsty during the day, try sugar-free gum, hard candy, a single popsicle or frozen grapes.
- Ask your doctor what is your personal fluid restriction
Limiting Fluid Intake

Fluid intake should not exceed 1.5 - 2L per day.

- Juice and Water
- Coffee and Tea
- Ice Cream and Jello
- Some Fruit (e.g., Watermelon)
- Soup
Heart Failure Medications

Your medications each act in a different way to help you feel well. Take your medications every day as directed:

- Do NOT skip medications, even if you are feeling better.
- NEVER take more medication than prescribed.
- If you miss a dose, do NOT double up on medication, unless told to do so by your healthcare provider.

Be informed and prepared:

- Carry a list of your medications (including non-prescription medications, vitamins, and natural products/herbal medicines), doses, and how often you take it in your wallet or purse and show it to all of your doctors.
- Carry plenty of medications with you when you travel.
- Know what each medication is for and what it looks like.
- Call your pharmacy for a refill several days BEFORE you are out of your medication.

Report to your doctor:

- If you are concerned you may have medication side effects.
- If you are not able to afford your medications, there are programs available. Ask your nurse or case manager.

Call your doctor or pharmacist if you have any questions about your medications or before taking any over the counter medications or supplements.

Exercise and Stay Active

Benefits of Exercise
- Improve your EF (ejection fraction)
- Improves flexibility, strength, sleep, weight
- Reduces risk factors, such as high blood pressure, high cholesterol, high blood sugar

How to stay active
- Choose an activity that you enjoy: walking, swimming, water aerobics, dancing, silver sneaker program
- Exercise with someone—it will keep you motivated
- Include activity in your daily routine. Ask your doctor about cardiac rehab
- Discuss exercise programs with your doctor. Your doctor may recommend programs such as outpatient cardiac rehab

When should you stop exercising?
- If you develop chest pain or pressure
- If you feel dizzy, like you are going to pass out
- If your heart is racing
Cardiac Rehab for Heart Failure

Cardiac Rehab is an outpatient exercise program designed specially to you. This heart monitored class, taught by exercise physiologist and nurses, over the course of 36 sessions or 12 weeks, can help improve your heart health. This program is usually covered by insurance companies and is 3x/week with a focus on building up endurance and helping get you in a physical activity routine.

With heart failure you may experience fatigue, getting up and moving around can help increase your energy level. It can reduce high blood pressure, high cholesterol, stress, anxiety and depression.

Staying active is best for your heart health, which can be as simple as walking for a couple minutes every day. When walking at home, walk at a comfortable pace. You should be able to talk and walk without feeling short of breath.

Introducing HF Path™

The path to a better quality of life.

The American Heart Association is pleased to launch HF Path™ — a versatile, intuitive tool that enables heart failure patients to better control their condition by managing symptoms, tracking medications, and maintaining a healthier lifestyle.

HF Path™ educates patients about heart failure, empowering them to play an active role in the management of their own health.

Available for download on the App Store, Google Play or on the American Heart Association website, HF Path™ is designed to help patients enjoy a better quality of life.

PLEASE VISIT heart.org/HFPath

My Personal Goals
Heart Failure Resources

Heart Works: A heart failure education and support group
Join us to learn more about managing heart failure.

Location: The Christ Hospital | 7- South | Conference Room
Time: 1:00 p.m., fourth Wednesday of the month (holiday schedule may differ)

To participate by phone, call 513-621-0220, then enter passcode 764764#.

• Monthly group meetings focused on sharing and receiving knowledge, experience, and support.

For additional information or to RSVP, please call 513-585-0378.

Visit the American Heart Association for more info and heart healthy recipes www.heart.org/

You will have a follow up visit scheduled after discharge. It is very important to keep this appointment to be sure you are remaining stable.
